

Honeypot IDS – Exploit test-scenario report

Generated: 2026-09-24 10:45:04

Target: ids (local) (https://localhost)

Honeypot threshold: 80 · Score decay half-life: 300s

Each exploit below is run from a freshly reset threat state (Redis flushed + reverse_proxy shared dicts flushed) so its score is that CVE's own isolated value. The score/route are read from reverse_proxy's X-Threat-Score / X-Route-Target headers; the screenshot is the embedded browser at that URL.

2. Threat increase – repeated exploits

Threat state is reset once, then these two semi-randomly chosen exploits are run alternately for three rounds with **no reset between them**. The score ratchets up as the host IP's reputation accumulates:

- CVE-2023-28121 (WooCommerce Payments admin bypass)
- CVE-2024-2387 (Advanced Form Integration SQL injection)

Score progression: **100** → **100** → **100** → **100** → **100** → **100**

3. Threat decay

No reset here – this inherits the elevated score built up above, then samples the effective score over time while sending only benign requests. Measured samples are plotted against the analytic decay curve the router itself applies.
